REPLENISHMENT MODULE

SIMMS Software Replenishment Module

The Replenishment Module allows the user to manage demand/backordered quantities on sales orders. Once the sales order has been generated containing backordered items, the backordered items are then listed in the Replenishment Module. This module is separate from the Backorder Manager and is to handle all backorders and items that have reached their reorder points. The Replenishment Module allows the user to create batch purchase orders based on stock reorder values and customers' demand quantities on transactions.

As an enhancement of the Backorder Manager, users can view and act on their most pressing order needs quickly and easily.

For success, you need to meet the demands that your clients make is of utmost importance. Excessive stock leads to a lower profit margin, increased storage costs, and aging of goods on your own shelves, but when clients cannot get items in time you lose clients and sales. The SIMMS Replenishment module allows for calculation of this delicate balance so you always have the stock you need but never have warehouses sitting idle with stock. This combined versatility allows proper inventory management – the very goal of the SIMMS Inventory System.

Automatic creation of purchase orders, and streamlining your cost savings and employee time management allow you to physically administer your stock so that it's where it needs to be when you need it to be there. Lead times for vendors and the cost of overhead are taken into considerations, and other items often received from those same vendors allow you to maximize your ordering and re-ordering process.

Features:

Demand field: displays the total quantity required to fill all orders

Minimum field: lists the minimum quantities required for stock, which is defined in the Item Reorder Manager.

On Hand field: displays the current On Hand values

Unreceived field: displays quantities outstanding on purchase orders

On PO: allows the user to either select all items to be put on purchase order or choose specific items.

Quantity Field: displays the quantity going on purchase order
